

Strangeness Production in U+U vs $\sqrt{s_{NN}} = 193\text{GeV}$ collisions at RHIC

Srikanta Kumar Tripathy (for the STAR Collaboration)

Institute Of Physics, Bhubaneswar

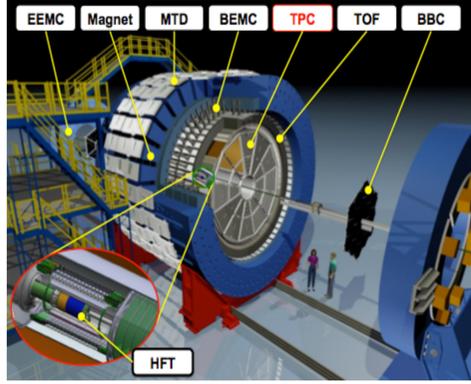

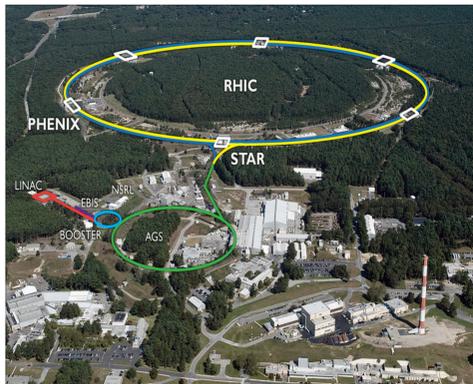

Abstract

Study of strangeness production in heavy ion collisions can infer properties of deconfined state of quarks & gluons such as baryon to meson enhancement, anti baryon to baryon ratio, nuclear modification factor & strangeness enhancement.

Unlike spherical nuclei like Au or Cu, U have intrinsic prolate deformation shape, which allows U+U collisions to have different geometrical orientation during collision. Moreover U+U collision can be characterized by larger energy density and and larger life time of fireball than Au+Au system .

STAR Experiment at RHIC

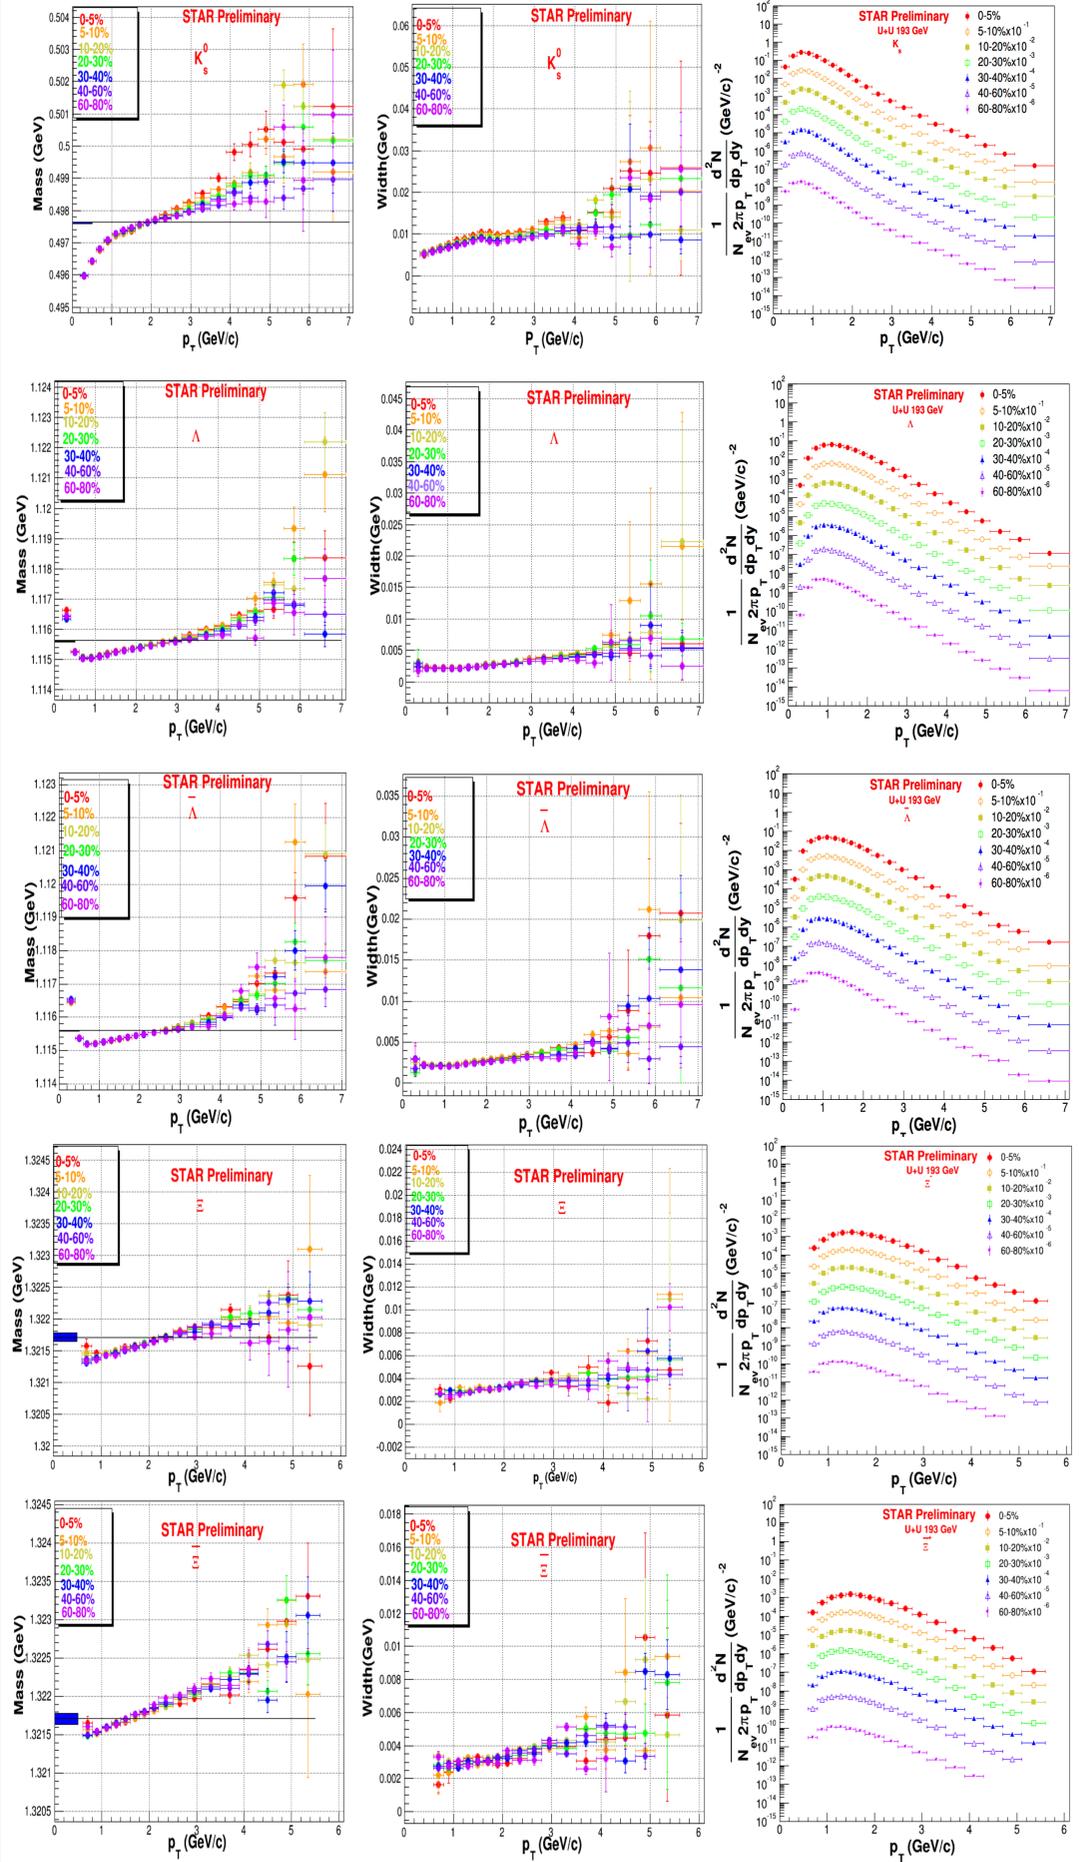

- Colliding systems:
Au+Au, Cu+Cu, Cu+Au,
U+U, d+Au, He+Au, p+p

- Center of mass energy:
 $\sqrt{s_{NN}} = 7.7\text{GeV}$ to 200GeV

TPC detector is used for this analysis.

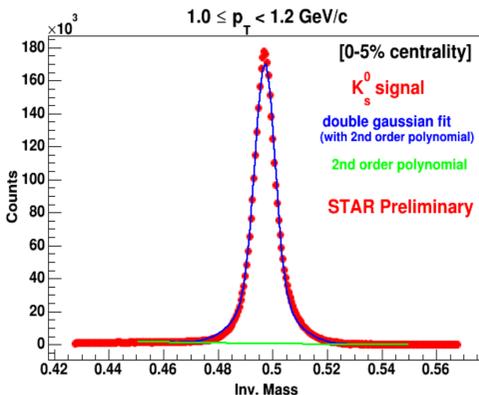

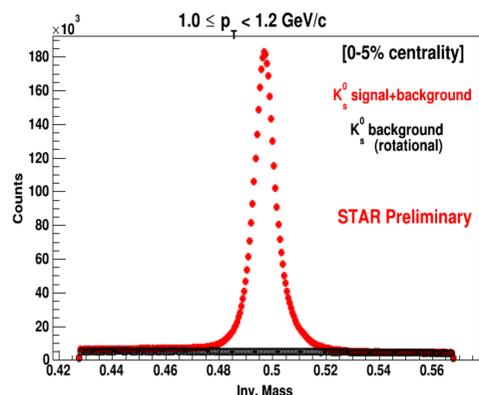

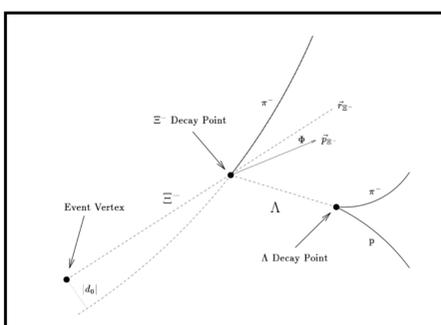

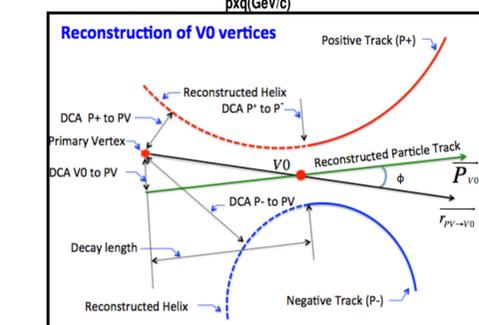

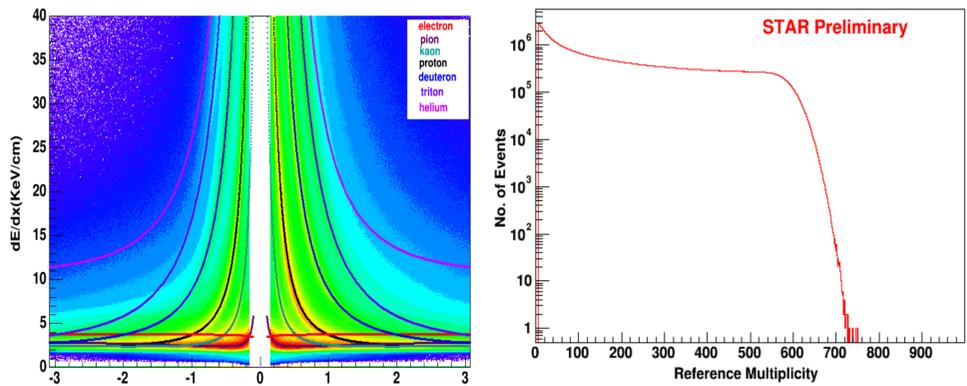

- Magnetic field: 0.5T
- Large acceptance: $|\eta| < 1.0$,
 $0 < \phi < 2\pi$
- Excellent particle identification capabilities (Using Time Of Flight and Time Projection Chamber)

Results:

Error bars are statistical only.

Analysis Technique

- ✓ First measurement of strange hadrons (K_s , Λ & Ξ) in U+U vs $\sqrt{s_{NN}} = 193\text{ GeV}$ data via their dominant hadronic decay channels.
- ✓ Raw spectra analyzed in 7 different centralities.
- ✓ Measured mass of these particles are consistent with PDG value (less than 1% deviation).
- To incorporate detector acceptance & efficiency correction.
